However, the current version of pgRouting does not support the following features: The current version of pgRouting does not support: Support for routing with edge labels Having a decent amount of disk space Using HBase or the disk-based tables to store the shapefile's data Can this be done? A: This is not possible, the shapefile stores the data in a non-composable form and only Postgres is able to extract the "Geometry" data from the shapefile for geocoding and routing. I agree with the other poster. I had a very similar problem. I even suggested that the coat the water with a bowl of cold water first to reduce the amount of heat generated by the water. After that the cooking itself went smoothly. The other problem we had was that the fire was almost out. We waited a long time and just when we got fed up and were going to cook a couple of my favorite veggies, the charcoal box was red hot and the embers were glowing. We had to start over again. We got better and better. We actually found that the rainforest hardwood coals were much better. They were very hot and were a nice bed for a fire. We also found that the bamboo fire starters were a huge help. Good luck, we were miserable before we had everything figured out. I think the Japanese call it seishun.Q: XSLT for-each loop with attribute value I have a problem with the following XSLT code: I want to get every attribute from all 'Echo' Tags and output it like this: Echo (Some Attributes) instead of: (Some Attributes) The code I wrote looks like this: Anybody who can help me out? There are many 82157476af
